Madden 24:

I play a video game called Madden. This is a simulation football game, where you can play people online using NFL teams and players. In Madden there is a game mode called Ultimate team where users can create their own football team consisting of NFL players in the league right now and from the past. Each week Madden releases new players that are better than the older ones, so you need to make sure your team is updated to make sure you can still compete. Each user wants to own the best players to create the best team possible.

Problem:

Issue is you have to fill up a 25 man roster and you have over 3,000 players to choose from. Along with that each team has an offensive and defensive scheme to choose, that determines the value of each position on the team. To make this easier I want to create a database that contains all the players, and schemes in madden to help users figure out what players they should try and get. It will allow users to find players that will help with their scheme and bring the most value to their team by comparing players on their team to all other available players

Nouns:
- Players
- Positions
- Teams
- Schemes
- Users

Verbs:
- Updated
- Consists
- Choose
- Owned
- Create
- Compare

Rules:
- A user has a team with at least 25 players
- A user's team has to have at one offensive and defensive scheme

- Players owned by the user will be compared to players available in the game to see where improvements can be made to a team.
- Each scheme has specific positions that work better in it, making those positions more valuable for a user.
